

FIRST MATE · INTERNAL PLAN

Geofenced Attendance

Replacing the Google Form clock-in with a location-verified flow — quicker than scanning a QR code, with confidence that attendance is logged from the office.

Attendance Plan · 2026

THE PROBLEM

A typed email proves nothing

No presence check

A team member can submit the Google Form from anywhere — the office isn't required.

No identity check

Anyone can type any email into the form; nothing verifies who actually submitted it.

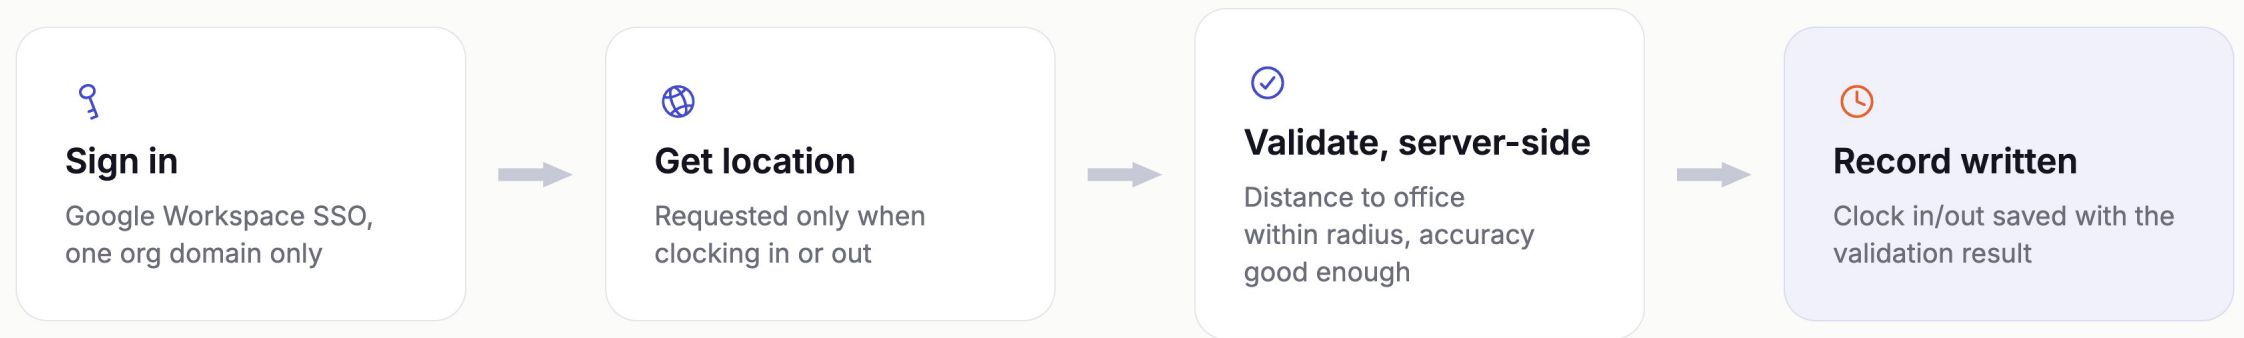

No audit trail

A spreadsheet row can't show how — or whether — attendance was actually validated.

Goal: faster than scanning a QR code, with confidence it's logged from the office

THE FLOW

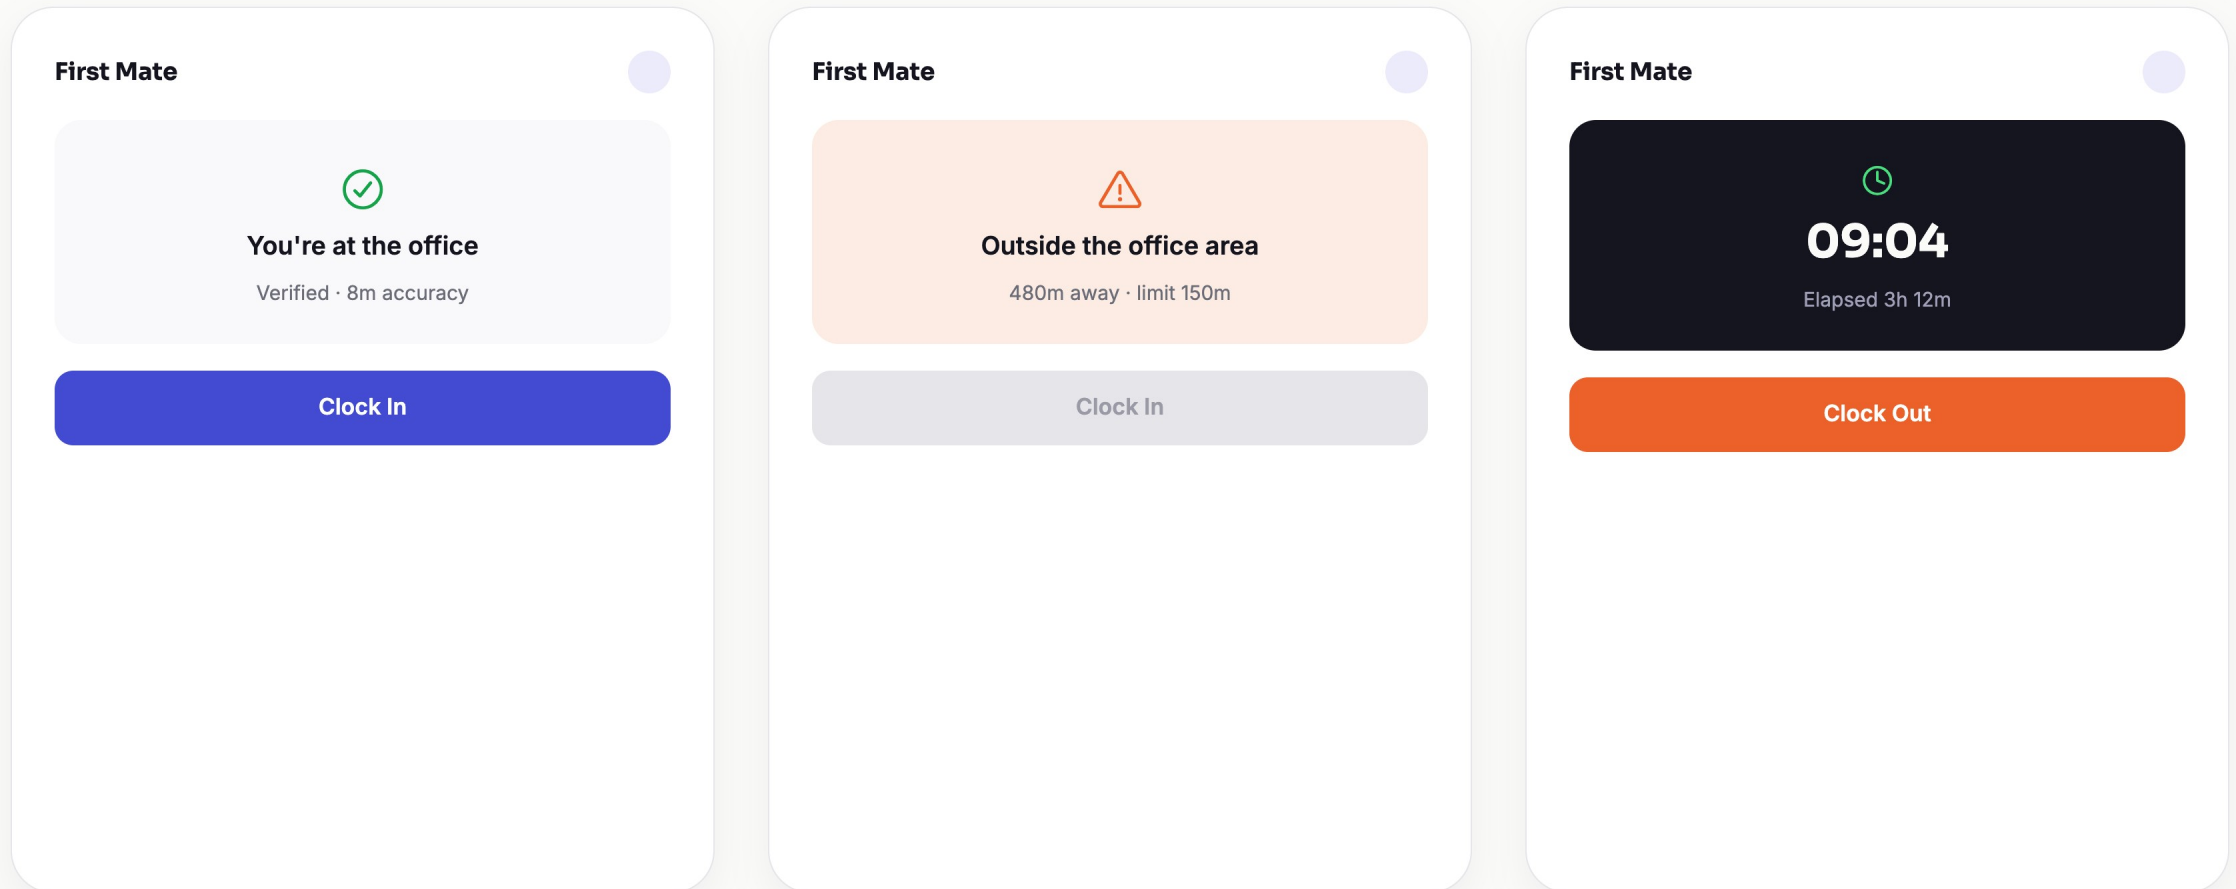

Location is checked once, at the moment of action

No continuous or background location tracking — ever

SAMPLE SCREENS

Three states, one screen

Loading and location-permission states live in the [sample screens canvas](#)

ACCESS

Two roles, nothing in between

Capability	Admin	Team Member
Clock in / clock out	Yes	Yes
Change office location & radius	Yes	No
Change the accuracy threshold	Yes	No
Edit the report link	Yes	No
Print the attendance QR shortcut	Yes	No

Admin is a hardcoded allow-list of emails — no in-app role management, no Manager role

SETTINGS

Four dials, all Admin-only

Office location

Latitude / longitude, set by dropping a pin on a map — no manual coordinate entry

Geofence radius

In meters, applied to every clock in/out attempt

Accuracy threshold

Defaults to 50m; a poor GPS reading is rejected before it's ever compared to the radius

Report link

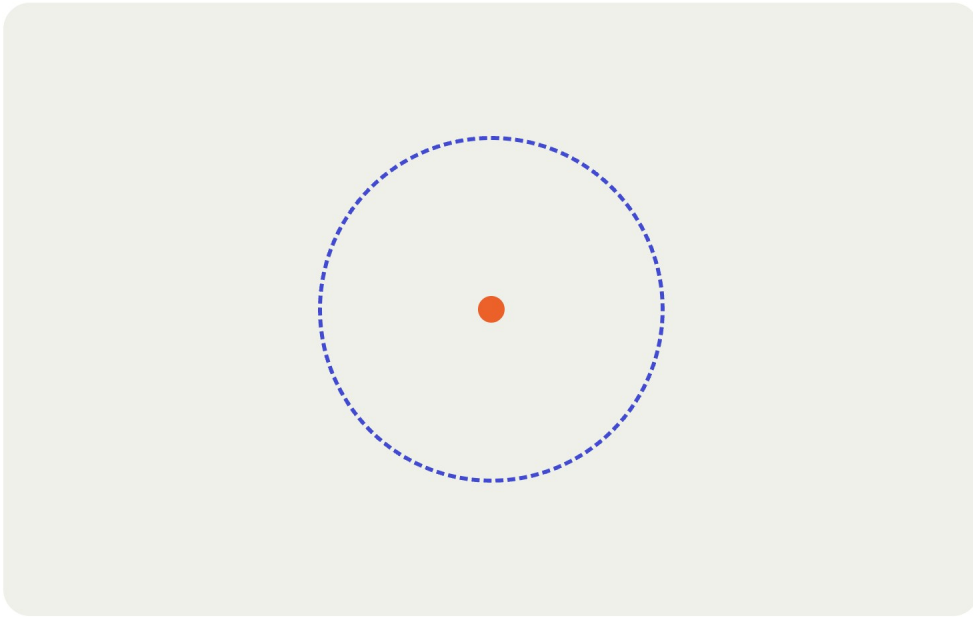

URL to the Google Sheet used for reporting — editable, not synced

One office location for the whole org — not per branch, not per team member

SAMPLE SCREENS

Admin settings, at a glance

Office location

Drag the pin to set the office location — no manual coordinates

Geofence radius

150 m

Accuracy threshold

50 m

sheets.google.com/.../attendance-2026

Admin-only · not wired to any data in v1

This settings panel is Admin-only — Team Members never see it

ATTENDANCE RECORD

Written once, never edited

Every clock in and clock out is stored with enough detail to answer "how was this validated?" months later — kept indefinitely, no deletion policy for v1.

Team member	jane@firstmate.tech
Type	Clock in
Timestamp	09:04:12
Coordinates	38.7223, -9.1393
Accuracy	12m
Geofence check	Passed

EDGE CASES

Every failure gets a plain-language reason

Situation	What the team member sees
Permission denied / location services off	"Location access is required to clock in"
Can't get a location	"Checking location..." then a retry prompt
Accuracy too poor	"A more accurate location is needed - try again outdoors"
Outside the radius	"You need to be within the office area to clock in"
Geofence not yet configured	Action disabled; "Attendance isn't set up yet"
Already clocked in/out today	Only the valid next action is ever shown
Network unavailable	"No connection - try again"

Nothing here is client-configurable

Google Workspace SSO

Restricted to one organization domain, checked app-side too — not configurable

Admin is a hardcoded list

No role-management UI. Everyone else is a Team Member by default, from first sign-in

Server validates, always

The distance and accuracy check runs server-side — a client can't fake a pass

CONVENIENCE

A QR code returns — as a shortcut, not a check

What it is

One static code, printed by an Admin and posted at the office. Scanning it opens the app's URL — nothing more.

What it isn't

Not a location signal, not an identity check, not part of validation. The full geofence check runs exactly the same after opening it.

REPORTING

A link today, automation later

The old Google Form gave a Sheet for free. v1 keeps that habit with an Admin-editable link to an external Sheet — no export, no sync, populated by hand until it's worth automating.

Visible to Admins only · not wired to any data in v1

SCOPE

v1 draws a clear line

In scope

- Geofenced clock in / clock out
- Configurable office location & radius
- Configurable accuracy threshold
- Google Workspace SSO, one domain
- Write-once attendance records

Not in v1

- Continuous / background location tracking
- Multiple office locations
- Manager role or in-app reports
- Automated Sheet export or sync
- Data retention / deletion policy
